## Upper Confidence Bound Algorithm

**Step 1**. At each round n, we consider two numbers for each ad i:

- $N_i(n)$  the number of times the ad i was selected up to round n,
- $R_i(n)$  the sum of rewards of the ad i up to round n.

Step 2. From these two numbers we compute:

• the average reward of ad *i* up to round *n* 

$$\bar{r}_i(n) = \frac{R_i(n)}{N_i(n)}$$

• the confidence interval  $[\bar{r}_i(n) - \Delta_i(n), \bar{r}_i(n) + \Delta_i(n)]$  at round n with

$$\Delta_i(n) = \sqrt{\frac{3 \log(n)}{2 N_i(n)}}$$

**Step 3**. We select the ad i that has the maximum UCB  $\bar{r}_i(n) + \Delta_i(n)$ .
